

Ammonium metavanadate for all-vanadium liquid flow battery

Overview

The preparation method comprises the steps that vanadium slag, a calcium-based additive and return slag are roasted at first, a vanadium-containing spinel structure in the vanadium slag is damaged and decomposed under the action of the calcium-based additive and the return slag during. The preparation method comprises the steps that vanadium slag, a calcium-based additive and return slag are roasted at first, a vanadium-containing spinel structure in the vanadium slag is damaged and decomposed under the action of the calcium-based additive and the return slag during. An electrolyte was prepared using ammonium metavanadate (AMV) to apply in the all-vanadium redox flow battery (VRFB). The component and composition of the prepared electrolyte by AMV were analyzed by X-ray diffraction (XRD) and inductively coupled plasma (ICP). It was confirmed from the analysis.
