

# Are solar panels considered single blocks

## Overview

---

Single PV cells (also known as “solar cells”) are connected electrically to form PV modules, which are the building blocks of PV systems. The module is the smallest PV unit that can be used to generate substantial amounts of PV power. A solar array is a group of solar modules (often referred to as solar panels) organized to work together and produce a combined power output larger than that of an individual module. These systems have several advantages: they are cost-effective alternatives in areas where extending a utility power line is very expensive; they have no moving parts and require little maintenance; and they produce electricity without polluting the environment. This publication will introduce you. Why are solar cells divided into blocks?

1. The requirements of Chapters 1 through 4 apply to these installations, except as specifically modified by Article 690.
