

Bird resting on photovoltaic panel

Overview

There are several clear ways to stop birds from damaging your solar panels. Large solar installations, particularly those utilizing photovoltaic panels, can create a visual illusion that mimics the appearance of water bodies from the air. This optical confusion can lead migratory birds to attempt landings on what they perceive as lakes or ponds, resulting in collisions. Roof-mounted solar panels provide just the right space for birds to nest, but the consequences can be severe. Key problems include: Hotspots and efficiency loss: Nesting material and droppings shade parts of the panel, creating local “hotspots. Birds see them as perfect spots to rest or nest. But for your home, bird visits are not always a good thing. Despite their benign nature, they inadvertently attract birds.
