

Can photovoltaic panels be installed in thunderstorm areas

Overview

Solar energy systems are built to withstand the most extreme weather conditions, including high-speed winds, hurricanes, hail, and snowstorms. In rare cases, however, particularly severe weather can cause damage to solar installations in many parts of the United States. Total array loss from Hurricane Maria. Photo from Gerald Robinson, Lawrence. As solar energy becomes an increasingly popular choice for homeowners and businesses alike, understanding the resilience of solar panels during storms and learning how to protect these installations from severe weather is crucial. Because, as advanced and high-tech as solar technology has become, events such as thunderstorms, hurricanes, and derechos¹. Often times these winds are unobstructed, meaning that they have a clear path towards a PV array. Renewable energy and distributed energy systems have the potential to provide power. According to Solar Under Storm II, a report released in 2020 by The Rocky Mountain Institute and The Clinton Foundation, there are quite a few best practices for solar installers in high-wind prone areas that installers should consider when installing solar panels in areas where hurricanes are.

Can photovoltaic panels be installed in thunderstorm areas

Severe Weather Resilience in Solar Photovoltaic System Design

On-site solar photovoltaic (PV) systems can be made more resilient to severe weather events by leveraging lessons learned from field examinations of weather-damaged PV systems and from ...
