

# Does the generator room need to be ventilated

## Overview

---

Proper ventilation is essential for any generator setup. Designing ventilation for a generator or transformer room is one of those things that practically every MEP engineer has to do at some point or another in their careers. When a generator is installed and operated in an indoor environment, adequate ventilation for heat dissipation and combustion is required. Keep it at least 20 feet from your home, with the exhaust pointing away from living areas, people, and pets. Without enough airflow, it can overheat or release harmful gases. But they also pose risks if not used correctly.
