

Electrical grid old and overwhelmed

Overview

electric grid, which consists of three main interconnections and delivers power to millions, is reaching a critical juncture. Much of the infrastructure was built 50-75 years ago and is struggling to keep up with modern energy demands, weather events, and the transition. Aging US transmission lines, if not replaced, threaten grid reliability, national security, and economic competitiveness, creating an urgent need for modernization, resilience, and interregional upgrades. The United States is quietly approaching a major inflection point in its infrastructure story:. In the critical shift to renewable energy, an outdated electrical grid system is threatening to slow the transition. Modernizing grids is critical not just to the need to move away from fossil fuels and tackle climate change, but also to withstanding climate impacts and helping people survive. The U. The electric infrastructure in the U.

Electrical grid old and overwhelmed

Rising electricity prices and an aging grid challenge the nation as

The nation's current electricity grid is not ready to supply all that energy. And even if the electricity could be generated, transmission lines are aging and not up to carrying all that
