

# Electricity policy netherlands

## Overview

---

The Netherlands has set a target of 70% of electricity from renewable sources (mainly solar and wind power) by 2030. Government action plays a pivotal role in ensuring secure and sustainable energy transitions and combatting the climate crisis. What is more, grid congestion renders regulations insufficiently compatible with reality, and EU regulations have been. The IEA examines the full spectrum of energy issues including oil, gas and coal supply and demand, renewable energy technologies, electricity markets, energy efficiency, access to energy, demand side management and much more. The surprising part is that it is not only huge corporations that will benefit. Since the National Climate Agreement in 2019, which included binding climate targets for 2030 and 2050, the shift in ambitions and the speed of the transition have been remarkable.
