Overview

This guide provides a clear, practical comparison of NEC and IEC grounding principles specifically for PV and storage applications. For grid-scale battery energy storage systems (BESS), grounding and bonding is essential for safety and performance. These low resistance levels allow fault currents to easily discharge into the ground, protecting. System grounding falls into 3 general categories: solidly grounded, ungrounded, or resistance grounded, with there being different subcategories of resistance grounding. It is acknowledged that there are other types of grounding methods beyond these 3, but they are rare and beyond the scope of this. However, the grounding process and methods differ slightly, offering multiple options, such as separate grounding or combined grounding. It starts with fundamental BMS concepts relevant to various applications, then discusses key design considerations.

Energy storage system grounding method

Eaton system grounding with DER's

Several example system configurations with multiple energy sources and the scenarios that can lead to changes in system grounding type are provided for reference.
