

Exhaust system generator working principle

Overview

The main function of a diesel generator exhaust system is to safely remove harmful gases produced during operation. As the engine burns fuel, it creates exhaust gases that must be vented out of the generator and away from people and equipment. The exhaust system consists of several parts, including. Diesel Generators (DG sets) are essential backup power sources used in industries, commercial establishments, and residential areas to ensure an uninterrupted power supply during grid failures. While the engine's cooling system carries away roughly one-third of the fuel's heat, another third leaves the set as hot exhaust gas.

Exhaust system generator working principle

9.5.8 Diesel Generator Air Intake and Exhaust System

The exhaust gas system collects the exhaust gas from the individual cylinders and conveys them via the engine-mounted turbocharger, emissions equipment, and an exhaust gas silencer to the outside.
