

# Fireproof material plus photovoltaic panels

## Overview

---

There are several design choices that can limit fire spread if ignition occurs: Use a complete system (PV panels, securement, and roof assembly) that has been tested to simulate actual field conditions. ZAG testing confirms: flames extinguish and spread is eliminated. r EN 13501-1 were designed for roofs without solar panels. With PV installed, conditions. Installing a photovoltaic (PV) system on the roof of a building introduces new fire risks to the building. First, the PV installations have been shown to increase the chances of ignition through the failure of any of the electrical components of the system. They provide clean electricity and make an important contribution to the energy transition.

### Photovoltaic fire safety:

## Comprehensive measures to mitigate fire risks

For limiting the consequences of a fire, it has been shown in experiments that the roof membrane type and the type of PV panels play a minor role compared to the type of insulation material.
