

# Flow batteries are sought after by capital

## Overview

---

Though flow batteries currently represent a higher upfront capital investment than a similar-sized lithium-ion configuration, they become more competitive when evaluated on a total cost of ownership basis over a 20-to-30-year life cycle. Flow batteries store energy in liquid electrolytes that circulate through a central electrochemical stack where chemical energy is converted to electricity and vice versa. Unlike lithium-ion, where energy and power are tightly coupled in each cell, flow batteries separate them: energy capacity. This technology strategy assessment on flow batteries, released as part of the Long-Duration Storage Shot, contains the findings from the Storage Innovations (SI) 2030 strategic initiative. The objective of SI 2030 is to develop specific and quantifiable research, development, and deployment (RD&D). Researchers in Italy have estimated the profitability of future vanadium redox flow batteries based on real device and market parameters and found that market evolutions are heading to much more competitive systems, with capital costs down to €260/kWh at a storage duration of 10 hours. If you haven't heard, the energy storage market is booming. Demand is surging for these battery types due to widespread use in electric vehicles, consumer electronics and utility-scale storage systems. 20 million in 2025, poised for dramatic expansion to \$610.

### High Voltage Solar Battery

### Electrolyte tank costs are an overlooked factor in flow battery

The economic viability of flow battery systems has garnered substantial attention in recent years, but techno-economic models often overlook the costs associated with electrolyte tanks.

[Learn More](#)

### Capital cost evaluation of conventional and emerging redox flow

The capital costs of these resulting flow batteries are compared and discussed, providing suggestions for further improvements to meet the ambitious cost target in long-term.
