

Gigawatts of solar power capacity

Overview

In 2024, generators added a record 30 GW of utility-scale solar to the U. We expect this trend will continue in 2025, with 32. power grid in 2025 in our latest Preliminary Monthly Electric Generator Inventory report. This amount represents an almost 30% increase from 2024 when 48. 6 GW of capacity was installed, the largest. Cumulative installed solar capacity, measured in gigawatts (GW). Data source: IRENA (2025) - Learn more about this data processed This is the citation of the original data obtained from the source, prior to any processing or adaptation by Our World in Data. To cite data downloaded from this page. "Solar power is the fastest-growing source of new electric generating capacity in the United States, driven by large-scale solar photovoltaic (PV) projects built by electric utilities and independent power producers," the agency reminds everyone. "In our most recent monthly inventory of power. Although you may not have remembered the date, you've probably heard of Doc's DeLorean, which takes 1. Admittedly, our national labs haven't quite figured out time travel just yet, but they do analyze power. 3 terawatts (TW) of generation capacity, as well as nearly 29,000 MW of energy storage, an 11,000 MW increase in energy storage in the past year. Led by the rapid rise of solar PV, renewables' expansion is taking place in a context of.

Gigawatts of solar power capacity

United States sets new record with 50 GW of installed solar capacity

In 2024, the United States added 50 gigawatts (GW) of solar power to its grid, marking the largest single-year addition of capacity by any energy technology over the past two decades.
