

# Grid-connected inverters can be divided into several categories

## Overview

---

There are four different categories under this classification. String inverters, typically rated around a few hundred Watts to a few kW. Multi-string inverters, typically rated around 1 kW to 10 kW. Considering the classification based on the mode of operation, inverters can be classified into three broad categories: Inverter classification according to Interconnection types is discussed in EME 812 (11. Grid connection and role of inverters). The branch inverters all contain a maximum power. Grid-connected inverters are power electronic devices that convert direct current (DC) power generated by renewable energy sources, such as solar panels or wind turbines, into alternating current (AC) power that can be fed into the electrical grid or used locally. As a result, a DC input becomes an AC output. At the beginning of the development of photovoltaic grid-connected inverter, the power frequency transformer.
