

How big is the solar container system

Overview

Short answer: The Solar System is a disc shape, 244 astronomical units wide (244 times the distance from the Sun to the Earth, or about 36. Long answer: There is some disagreement over exactly where the edge of the Solar System is, so there are disagreements over its. On this scale, the Sun, by far the largest thing in our solar system, is only a ball about two-thirds of an inch (17 millimeters) in diameter sitting on the goal line — that's about the width of a U. [11] The system formed about 4.6 billion years ago when a dense region of a molecular cloud collapsed, creating the Sun and a protoplanetary disc. The size of the solar system may seem like it has a simple answer, yet there is no universally agreed upon definition for where our solar system ends. The four outer planets are Jupiter, Saturn, Neptune, and Uranus, giant planets that consist mainly of either gases or ice. BBC Earth Lab's Dom Burgess.

Highvoltage Battery

The Scale of the Solar System

Many images of the solar system do not do justice to how small the planets are relative to the Sun, or how distant they are from the Sun and each other. The solar system is really mostly empty space.

Flexi answers

To give you an idea of how big that is, 1 AU is the average distance from the Earth to the Sun, which is about 93 million miles (150 million kilometers). So, the solar system is about 100,000 times

that distance!

 Inner Solar System
 Outer Solar System
 Trans-Neptunian region

The Solar System is the gravitationally bound system of the Sun and the masses that orbit it, most prominently its eight planets, of which Earth is one. The system formed about 4.6 billion years ago when a dense region of a molecular cloud collapsed, creating the Sun and a protoplanetary disc from which the orbiting bodies assembled. Inside the Sun's core hydrogen is fused into helium for billions of years, releasing energy

which i...
