

How does emissions trading work

12.8V6Ah

Nominal voltage (V):12.8
Nominal capacity (ah):6
Rated energy (WH):76.8
Maximum charging voltage (V):14.6
Maximum charging current (a):6
Floating charge voltage (V):13.6~13.8
Maximum continuous discharge current (a):10
Maximum peak discharge current @10 seconds (a):20
Maximum load power (W):100
Discharge cut-off voltage (V):10.8
Charging temperature (°C):0~+50
Discharge temperature (°C): -20~+60
Working humidity: <95% R.H (non condensing)
Number of cycles (25 °C, 0.5c, 100%dod): >2000
Cell combination mode: 32700-4s1p
Terminal specification: T2 (6.3mm)
Protection grade: IP65
Overall dimension (mm):90*70*107mm
Reference weight (kg):0.7
Certification: un38.3/msds

Overview

Cap and trade is a market-oriented approach to controlling pollution that sets a firm limit on total emissions while providing economic incentives for reduction. The system works through two interconnected components: a regulatory cap and a market-based trading mechanism. Effectively designed emissions trading programs can protect human health and the environment, offer flexibility for individual emissions sources to tailor unique compliance paths. Emissions trading, also known as 'cap and trade', is a cost-effective way of reducing greenhouse gas emissions. The trading of a finite number.

How does emissions trading work

 LFP 280Ah C&I

Emissions trading , Pollution Control & Climate Change

Emissions trading, an environmental policy that seeks to reduce air pollution efficiently by putting a limit on emissions, giving polluters a certain number of allowances consistent with those limits, and then ...

Emissions trading

Overview Introduction History Economics Comparison with other methods of emission reduction Trading systems Criticism Effectiveness

Emissions trading is a market-oriented approach to controlling pollution by providing economic incentives for reducing the emissions of pollutants. The concept is also known as cap and trade (CAT) or emissions trading scheme (ETS). One prominent example is carbon emission trading for CO2 and other greenhouse gases which is a tool for climate change mitigation. Other schemes include sulfur dioxide and other pollutants.
