

# How many watt-hours of wind power can generate in a day

## Overview

---

On average, a modern utility-scale wind turbine can produce approximately 3 to 12 megawatt-hours (MWh) of electricity per day, depending on factors like wind speed, turbine size, and location. This amount can power hundreds to thousands of homes daily. The Gansu Wind Farm is a major contributor to China's renewable energy goals, with a total of 434 billion kilowatts (kWh) of electricity produced annually. Wind is the third largest source. The amount of electricity a wind turbine generates daily varies significantly. This reduces electricity production when high winds occur and people need continuous power from the wind.
