

Is it dangerous to grow vegetables under photovoltaic panels

Overview

Crops can thrive under solar panels. In fact, the microclimate generated by the solar panels can create crops that are stronger, tastier, and healthier than crops grown with a traditional farming method. There is a common misconception that crops require access to full. Agrivoltaics refers to any type of farming or crop cultivation that occurs underneath or around solar panels. Solar panels also protect crops from cold weather and create a favorable microclimate beneath them. A recent article in Agritecture says this: “In 2019, a study from the universities of Arizona and Maryland found great. Can you grow crops under solar panels without risking plant health or crop yield?”

There is one solution through the practice of agrivoltaics. The. And while the grass under your trampoline grows by itself, researchers like me in the field of solar photovoltaic technology — made up of solar cells that convert sunlight directly into electricity — have been working on shading large crop lands with solar panels — on purpose. Doubling up on land use in this way could help feed the world's growing population while also providing sustainable energy.
