

# Is the solar system nitrogen

## Overview

---

Within our own solar system, nitrogen is a significant component of many planetary atmospheres. Earth's atmosphere is composed of approximately 78% nitrogen gas (N<sub>2</sub>), making it the most abundant gas on our planet. 7%. Nitrogen is a nonmetal and the lightest member of group 15 of the periodic table, often called the pnictogens. It exists as gas and dust clouds within the interstellar medium (ISM), the material between star systems, contributing to both diffuse. Since we are talking about harvesting nitrogen from other planets and moons, Earth is likely to be the major source of orbital nitrogen for a long, long time. Surrounding the Sun are the terrestrial planets—Mercury, Venus, Earth, and Mars—made mainly of rock and metal, while the outer planets, known as gas giants, include.

## Is the solar system nitrogen

### Nitrogen in the Solar System , Request PDF

Nitrogen within the solar system is not isotopically uniform: 15N/14N ratios in planetary objects such as Earth, Mars, and Jupiter range from 1.9 to  $5.9 \times 10^{-3}$  (1), some meteoritic materials

Higher Anti-Rust Performance  
Lower Internal Impedance

### Nitrogen isotope variations in the Solar System

The relative proportion of the two isotopes of nitrogen, 14 N and 15 N, varies dramatically across the Solar System, despite little variation on Earth.

## New Insights Into How Earth Got Its

## Nitrogen , News , Astrobiology

New research by Rice University shows that Earth's nitrogen came from both inner and outer regions of the disk that formed our solar system, contrary to earlier theory.
