Blue Frontier is commercializing ESEAC technology by integrating it into its Dedicated Outdoor Air System. Installed in Florida, the 20-ton system pictured here controls temperature and humidity while operating primarily during periods of solar photovoltaic production. Photo from Blue Frontier A. Compressed Air Energy Storage (CAES) has emerged as one of the most promising large-scale energy storage technologies for balancing electricity supply and demand in modern power grids. Renewable energy sources such as wind and solar power, despite their many benefits, are inherently intermittent. This paper provides a comprehensive overview of CAES technologies, examining their fundamental principles, technological variants, application scenarios, and gas. Large-scale power storage equipment for leveling the unstable output of renewable energy has been expected to spread in order to reduce CO<sub>2</sub> emissions. This technology strategy assessment on compressed air energy storage (CAES), released as part of the Long-Duration Storage Shot, contains the findings from the Storage Innovations (SI) 2030 strategic initiative. The objective of SI 2030 is to develop specific and quantifiable research, development.
