

# Packbattery auxiliary materials

## Overview

---

Our company's battery pack thermal management auxiliary materials include four categories: insulation cotton, aerogel, fiber, and new materials. Composite and polymer materials offer design flexibility and part integration potential that is not possible with incumbent metallic solutions, which can significantly improve energy. Battery pack design requires understanding both fundamental electrochemistry and application-specific engineering requirements. Custom battery pack applications have expanded significantly across electric vehicles, renewable energy systems, and portable electronic devices, each demanding precise. With the popularization of new energy vehicles, insulation and heat insulation materials in battery packs are widely used. Battery packs are integrated with multiple battery core modules to form a PACK. The PACK system is loaded on the chassis of the car. Insulation and heat preservation materials. CMC is an ionic chain polymer water-based binder that forms a transparent viscous glue after swelling with water. It has the advantages of being difficult to ferment, good stability, low price, safety and environmental protection. Energy Density: Dictates efficiency in space-constrained applications.
