

# Photovoltaic energy storage current detection principle

## Overview

---

CTs produce a secondary current proportionate to the primary current for safe and controllable measurement, operating on the electromagnetic induction principle. The percentage depends on how many turns the secondary side winding has, as seen in the accompanying image:. This article introduces a new control strategy for a bidirectional DC/DC converter used in photovoltaic energy storage systems (PV-ESSs), aimed to address the DC bus voltage deviation problem. Current sensors are needed throughout grid-tied systems for control of the. High-precision current/voltage sensors are key components for real-time monitoring and data acquisition. The results confirm the ability of the technique to correctly locali unication networks of distributed PV systems.
