

# Photovoltaic panels have diodes

## Overview

---

In fact photovoltaic solar cells or PV's as they are more commonly called, are no more than big, flat photo sensitive diodes. Solar panels consist of solar cells that convert sunlight into electricity through the photovoltaic effect. Mainly, we use two kinds of diodes for effective solar panels - bypass and blocking diodes. You may be wondering, what is the difference?

Well, not much. Current flows from high to low. Bypass diodes are connected in parallel across solar cells to provide an alternative current path when the voltage across a cell is negative due to shading or it becoming faulty. This use of bypass diodes in solar panels allows a series (called a string) of connected cells or panels to continue. Essentially, diodes in solar panels are electronic components that allow current to flow in one direction only, blocking potential harmful reverse currents.

### Blocking Diode And Bypass Diode

## For Solar Panels

Understanding the roles of blocking diodes and bypass diodes is essential for optimizing your system's performance--especially in both partial and full shading scenarios.
