

# Proportion of causes of photovoltaic panel fires

## Overview

---

According to Fraunhofer ISE, just 0.006 percent of photovoltaic systems cause major fire damage. Findings from Fraunhofer ISE and TÜV Rheinland point to three main causes: defective components (one third), planning errors (another third), and installation mistakes (the remaining). According to Fraunhofer ISE, just 0.03 fires per MW of solar power. Do solar panels significantly increase the risk of fire on a property?

It's a straightforward question that doesn't quite. The analysis revealed the most common causes of PV self-ignition. Still, mistakes and accidents can lead to devastating and even fatal fires. High-quality installation makes all the difference. While solar panel fires are uncommon, they can have severe consequences when they do occur. Although PV is a very safe technology and incidents. This is a key issue for rooftop solar projects, and for this edition of the Quarterly, we wanted to dive into fire risks to better understand the rates and causes, with help from two of our marketplace's solar installers.

### Are Solar Panels an Emerging Fire Risk

International data suggests that far fewer than 1 percent of all solar systems catch fire. Do solar panels significantly increase the risk of fire on a property? It's a straightforward question that doesn't quite ...
