

Punching holes in galvanized aluminum-magnesium square tubes for photovoltaic brackets

Overview

ProductionMetal offers a vast range of Shop Extrusion Punches designed to match exact hole clusters and stamping requirements. Their process includes: Engineers create tooling tailored to your extrusion's unique profile shapes, ensuring holes align perfectly with your design. UniPunch has several types of. Punching aluminum is a core technique in the metal fabrication industry. This highly efficient and cost-effective method makes it ideal for producing large quantities of precise metal parts. Aluminum, known for its. we use to routinely punched 5mm hole in 5/8" square 16G ERW, through one side only, square was undistorted, but there was a natural divot around hole extending out say 1/4" ish but probable only 1-2mm deep tops, but not as bad as you would expect. This technique can be performed on single sheets and continuous rolls of aluminum, known as coil punching. Holes, slots, or complex cluster patterns.
