

Reactions of vanadium flow battery

Overview

The reaction uses the : $\text{VO}^{2+} + 2\text{H}^+ + e^- \rightarrow \text{VO} + \text{H}_2\text{O}$ ($E^\circ = +1.00 \text{ V}$) $\text{V} + e^- \rightarrow \text{V}^{2+}$ ($E^\circ = -0.26 \text{ V}$) Other useful properties of vanadium flow batteries are their fast response to changing loads and their overload capacities. They can achieve a response time of under half a millisecond for a 100% load change, and allow overloads of as much as 400% for 1.

A technology review of electrodes and reaction mechanisms in vanadium

This work reviews and discusses the progress on electrodes and their reaction mechanisms as key components of the vanadium redox flow battery over the past 30 years.
