

Simple strokes of solar power generation principle

Overview

Photovoltaic technology converts sunlight directly into electricity. These cells are often grouped into solar panels found on rooftops or solar farms. Solar thermal systems focus on utilizing. As majority of our energy requirements are in the form of electricity, PV works on the principle of photovoltaic effect. Most of the technology works on the principle of reflection, radiation and. The amount of sunlight that strikes the earth's surface in an hour and a half is enough to handle the entire world's energy consumption for a full year. Sunlight energizes electrons, causing them to become activated and mobile. The two dissimilar semiconductors possess a natural difference in electric potential (voltage), which causes the electrons to flow through the external circuit, supplying power to the load.
