Solar and energy storage synergistic operation

Overview

This paper provides a comprehensive review of integration strategies for hybrid renewable energy systems, focusing on the synergistic combination of solar, wind, hydro, biomass, and other renewable sources with energy storage solutions. The transition to renewable energy sources is vital for meeting the problems posed by climate change and depleting fossil fuel stocks. A potential approach to improve the effectiveness, dependability, and sustainability of power production systems is renewable energy hybridization, which involves. Storage helps solar contribute to the electricity supply even when the sun isn't shining. These variations are attributable to changes in the amount of sunlight that shines onto photovoltaic (PV) panels or concentrating. To this end, this paper proposes a robust optimization method for large-scale wind–solar storage systems considering hybrid storage multi-energy synergy.
