

Solar cabinet system for explosion-proof room

Overview

Scientists at the Pacific Northwest National Laboratory developed this patent-pending deflagration prevention system for cabinet-style battery enclosures. Intellivent is designed to intelligently open cabinet doors to vent the cabinet interior at the first sign of explosion risk. Energy storage systems (ESS) with cabinet-type enclosures are becoming more common in industry because they allow for maximum battery capacity and smaller footprints, while still providing easy access to the interior space. However, the cabinets leave little room for the traditionally used exhaust. There has been a fair amount of news about battery storage systems being involved in fire and explosion incidents around the world. Do not forget that these are not the only safety issues when dealing with batteries. The battery rooms must be adequately ventilated to prohibit the build-up of hydrogen gas. During normal operations, off gassing of the batteries is relatively small. However, the concern is. Both the exhaust ventilation requirements and the explosion control requirements in NFPA 855, Standard for Stationary Energy Storage Systems, are designed to mitigate hazards associated with a?

| Validates safety performance of energy storage containers under real fire conditions by simulating:. Ideal for high-risk environments, these enclosures provide an added layer of safety by preventing explosions and leaks. Space-efficient and easy to install, these enclosures are. Most industrial off-grid solar power systems, such as those used in the oil & gas patch and in traffic control systems, use a battery or multiple batteries that need a place to live, sheltered from the elements and kept dry and secure.
