

Sudan reduced carbon emissions

Overview

Since 2015, Sudan has implemented several initiatives focusing on macroeconomic reforms, social protection, and environmental sustainability, with a strong emphasis on transitioning to a net-zero carbon economy. This interactive chart shows the breakdown of annual CO₂ emissions by source: either coal, oil, gas, cement production or gas flaring. This breakdown is strongly influenced by the energy mix of a given country, and changes as a country shifts to or from a given energy source. How are Sudan's CO₂. Sudan emitted about 137 megatonnes of CO₂-equivalent in the latest year, a small slice of the global total at roughly a quarter of a percent. Per capita emissions stand near 2.7 tonnes per capita per year-classified as moderate-and, in line with climate goals, should move closer to zero over time. This is in line with its national circumstances, development priorities and goals as stated in documents such as the Second National Communication (SNC), National Adaptation Plan (NAP) and Strategic Plan 2007-2033.

Sudan reduced carbon emissions
