

The maximum distance between green base stations

Overview

Each base station has a 120-degree field of view, so it's ideal to adjust its angle between 30 and 45 degrees to fully cover your play area. For optimal tracking, make sure that the maximum distance between the two base stations is 5 m (16 ft 4 in). In the ideal setup, Base Stations should be above head height (at least 6.5 feet / 2 meters), angled down by 30-45 degrees, positioned no more than 16 feet / 5 meters apart, and placed opposite one another in separate. The GNSS antenna (and, optionally, the base station radio antenna) is separate from the receiver. Because the GNSS antenna is separate, you can use the following optimized components: You can place a modular receiver in an easily accessible and secure location, safe from theft and the weather. By placing base stations strategically, you can minimize interference and ensure a strong, reliable signal. Additionally, it is important to.
