

The role of the intermediate pole of lithium battery pack

Overview

The Intermediate Pole acts as a conduit, guiding current efficiently to the battery cells. Current Distribution: The pole distributes current evenly across multiple cells, preventing hotspots and ensuring uniform charging. Sensors monitor this process to detect any imbalance. Explore. The lithium battery electrode is a coating composed of particles, which is evenly coated on the metal current collector. The lithium-ion battery electrode coating can be regarded as a composite material, which mainly consists of three parts: (1) Active substance particles; (2) A phase in which the. The global intermediate pole for battery market is experiencing robust growth, driven by the increasing demand for energy storage solutions across various sectors. The automotive industry, particularly electric vehicles (EVs) and hybrid electric vehicles (HEVs), is a major growth catalyst. The most common cathode materials used in lithium-ion batteries include lithium cobalt oxide (LiCoO₂), lithium manganese oxide (LiMn₂O₄), lithium iron phosphate (LiFePO₄ or LFP), and lithium nickel manganese cobalt oxide (LiNiMnCoO₂ or NMC).
