## Overview

---

We propose an innovative parcel delivery concept for last mile delivery (LMD) operations and develop an optimization model to support tactical planning decisions. Our model minimizes overall operating costs by determining optimal locations for micro depots and it allocates transport. Therefore, with the aim of improving the resilience of distribution networks, this paper proposes a model for the simultaneous planning of distribution automation and energy. The proposed model effectively addresses three simultaneous objectives, as illustrated in (8). The primary objective function. What does the three simultaneous energy storage storage are pumped hydro storage and thermal energy storage. Pumped hydro storage, which is a type of hydroelectric energy storage, was used as early as 189 in Italy and Switzerland before spre ffective deep decarbonization while maintaining. 52. 203-18 Prohibition on Contracting with Entities that Require Certain Internal Confidentiality Agreements or Statements-Representation. Acquisition cost means the (total) cost of the asset including the cost to ready the asset for its intended use. BMC Nursing is an open access, peer-reviewed journal that considers articles on all aspects of evidence-based nursing. The worldwide trend of urbanization, the rising needs of individuals, and the continuous growth of e-commerce lead to increasing urban delivery activities, which are a substantial driver of traffic and pollution in cities. Due to rising public pressure, emission-reducing measures are increasingly.
