

What is the damage rate of wind turbine generators

Overview

While generator annual failure rate is typically around 1%–4% (including full generator and up-tower replacements), the associated downtime is quite long, and replacement (disassemble/assemble) costs are high. Generator issues continue to remain a concern in the wind industry, both for stator-fed synchronous machines as well as for rotor-fed, wound rotor. Understanding common failure causes in wind turbines is essential for optimising performance and reducing maintenance costs. Each category encompasses various factors that contribute to the degradation or sudden breakdown of turbine components.

What is the damage rate of wind turbine generators

Wind Turbine Failures Review and Trends

Through the application of Pareto's rule, a set of components has been identified; although these provide little in terms of fault contribution, they do account for almost all downtime when they occur. ...
